

FitBuddy AI — Idea Brainstorming

Phase 1 • Brainstorming & Ideation

Core idea

- Build a local-first fitness planning application where a user completes an onboarding profile and receives a weekly workout/nutrition guidance plan.
- Keep the experience demonstrable locally through deterministic demo mode, while allowing optional Gemini generation when configured.

Functional ideas derived from the project

- Responsive user dashboard and profile/onboarding form.
- Weekly workout and nutrition guidance generation.
- Persistent storage of users, plans, and feedback in SQLite.
- Automatic rule-based plan adjustments based on saved feedback.
- Coach dashboard with user, plan, and feedback summaries.
- JSON REST APIs for profile, plan, feedback, coach summary, health check, and Swagger/OpenAPI documentation.
- Direct frontend serving through FastAPI.

Future idea directions

- Expand the coach dashboard with richer summaries while preserving the documented local-first architecture.
- Add more feedback categories and plan-adjustment rules.
- Extend the demonstration and documentation with additional test cases and user scenarios.
