

FitBuddy AI — Problem–Solution Fit

Phase 3 • Project Design Phase

Source note: Mapping is derived from documented objectives and features.

Problem-to-solution mapping

- Need for structured fitness inputs → profile/onboarding form captures goals, schedule, diet, equipment, limitations, and preferences.
- Need for a practical weekly routine → plan generation endpoint and Current plan panel provide weekly guidance.
- Need for iteration after experience → feedback capture plus automatic rule-based plan adjustments.
- Need for simple local demonstration → DEMO_MODE and deterministic local generator.
- Need for operational visibility → coach dashboard and JSON REST endpoints.

Scope boundary

- The supplied documentation does not provide quantitative user-validation results, clinical validation, or measured fitness outcomes. This document therefore describes documented feature fit rather than claiming validated effectiveness.
