

FitBuddy AI — Proposed Solution

Phase 3 • Project Design Phase

Solution overview

- FitBuddy AI is designed as a local-first web application. FastAPI serves the application and REST APIs, SQLite provides local persistence, HTML/CSS/JavaScript provide the user and coach interfaces, and optional Gemini integration supports AI-assisted plan generation.
- When live Gemini generation is unavailable, the project is designed to fall back to a local deterministic generator so the application remains usable.

Key user flow

- Open dashboard → complete profile → save profile and generate plan → review weekly plan → submit feedback → generate again → review adjustment.

Key design characteristics

- Local-first operation.
- Feedback-driven refinement.
- Separate user and coach interfaces.
- API-accessible core workflow.
- No separate Node.js build step.
