

FitBuddy AI — Code Layout, Readability & Reusability

Phase 5 • Project Development Phase

Project layout

- The application is separated into configuration, database, models, schemas, services, route entry point, frontend assets, and tests.
- This separation supports reuse of core business logic and keeps presentation code distinct from persistence and service logic.

Module map

- app/config.py — configuration.
- app/database.py — database connection/setup.
- app/models.py — data models.
- app/schemas.py — API schemas.
- app/services.py — business logic and feedback adjustments.
- app/main.py — application entry point and routes.
- app/static/index.html + app.js + styles.css — user interface.
- app/static/coach.html + coach.js — coach dashboard.
- tests/test_api.py — automated tests.

Readability/reusability practices supported by the documented structure

- Single-purpose modules.
- Structured API schemas.
- Reusable service layer for generation and feedback adjustment.
- Separate frontend assets for user and coach interfaces.
- Configuration through environment variables rather than hard-coded runtime settings.
