

FitBuddy AI — Testing Strategy & Checklist

Phase 6 • Project Testing

Testing basis

- The supplied documentation specifies pytest as the automated testing tool and states that the tests use the local generator and a temporary SQLite database, so a Gemini key is not required.

Functional test checklist

- Application starts with the documented Uvicorn command.
- User profile can be created/updated through the documented API.
- Plan generation endpoint is reachable.
- Generated plan is displayed in the user interface.
- Feedback can be submitted with rating, energy, difficulty, and comments.
- Feedback is persisted and used for rule-based adjustment.
- Generate again produces a refined plan.
- Coach summary and recent feedback endpoints are available.
- Health and Swagger/OpenAPI endpoints are available.

Important limitation

- The supplied documentation describes the test method but does not provide a test report with pass/fail counts. This document therefore does not invent numerical test results.
