

FitBuddy AI — Performance Testing Plan

Phase 6 • Project Testing

Purpose

- Assess responsiveness of the local web application and API workflow without claiming measured results that are not present in the supplied project materials.

Suggested measurements

- Startup time for the Uvicorn application.
- Response time for profile creation/update.
- Response time for plan generation in deterministic demo mode.
- Response time for feedback submission.
- Response time for coach summary and recent feedback endpoints.
- Behavior when multiple sequential or concurrent requests are made locally.

Test conditions to record

- Python version and machine configuration.
- DEMO_MODE setting.
- Database state/size.
- Number of sequential or concurrent requests.
- Observed minimum/average/maximum response time.
- Any errors or timeouts.

Current source-based conclusion

- The project is explicitly designed for a local-first classroom/demo workflow. No benchmark numbers are supplied in the source documentation, so measured performance should be added after running the tests.
